

Zakariya Raji

Senior Software Engineer · Distributed Systems · Fintech · AI · Blockchain

Nigeria zakariyaraji.dev zakariyyaraji@gmail.com <https://linkedin.com/in/zakariya-raji> zabilal

PROFILE

I design and build production software across fintech, backend infrastructure, distributed systems, AI/ML and blockchain — from financial ledgers and payment systems to intelligent applications and smart contracts. I build transaction systems where correctness, idempotency and failure recovery matter more than simply making an API respond quickly.

EXPERIENCE

GlobalTrust Mortgage Bank · Banking

January 2026 - Present

Senior Backend Engineer

- Designing backend services around customer accounts, transactions and financial state.
- Ledger-centred modelling so balances are derived from auditable postings.
- Integrating with core banking and external financial systems.
- Reconciliation between internal records and external statements.

InsureOnGo · InsurTech

2025 - 2026

Head of Engineering

- Taking features from product design to production deployment.
- Shaping the technical team's structure and engineering practices.
- Mentoring engineers on backend design and delivery.

Nomba · Fintech · Payments

2021 - 2023

Senior Backend Engineer

- Payment infrastructure for agent and merchant networks.
- High-volume transaction processing where networks and providers are unreliable.
- Transaction status management, retries and reconciliation.

OmitsFx · Cross-border payments

2025 - 2025

Senior Backend Engineer

- Transaction processing and settlement flows for cross-border transfers.
- Integrations with external payment and FX providers.
- Concurrency control and scalability in the transaction path.

- Spring Boot services for digital banking and lending products.
- Telecom infrastructure and solutions.

LANGUAGES

Production: Java, Go, TypeScript

Strong working knowledge:
JavaScript, SQL, Solidity

Currently expanding: Python, Rust

SKILLS

Backend	Spring Boot, Vert.x, Javalin, Node.js, NestJS, Express
Distributed systems	Kafka, Redis, Event-driven architecture, Microservices, CQRS, Event sourcing
Databases	PostgreSQL, MySQL, MongoDB, Elasticsearch, Logstash
Blockchain	Solidity, EVM, Foundry, Hardhat, OpenZeppelin, Slither, Viem, Ethers.js
AI	Python, LLMs, RAG, Agents, Embeddings, Vector search, Model APIs
Infrastructure	AWS, GCP, Docker, Kubernetes, Terraform, Helm, GitHub Actions, Linux
Frontend & mobile	React, Next.js, Angular, TypeScript, Flutter

SELECTED ENGINEERING WORK

- Financial Ledger · Reference architecture

A double-entry ledger where balances are derived from an immutable journal, every posting is balanced by construction, and retries cannot move money twice.
- Payment Processing Platform · Reference architecture

A payment lifecycle built around an explicit state machine, idempotent APIs, retry-safe provider calls, webhook deduplication and daily reconciliation.
- High-Throughput Event System · Reference architecture

Kafka topology for financial events: partitioning by business key for ordering, consumer groups for scale, bounded retries and dead-letter queues that preserve context.
- AI Radiology Platform · Concept

A conceptual platform connecting imaging, EMR and clinical workflows with AI inference as an assistive, audited step — the clinician always decides.
- Blockchain Staking Protocol · Concept

A staking protocol design: small single-purpose contracts, reward-per-share accounting, audited access control and events shaped for indexing.
- AI Engineering Agent · Research

Research into agents that understand a repository, plan, implement, run tests, review and fix — with tests and human review as the source of truth.
